

# Microdermabrasion

The process of Microdermabrasion is Physician-tested and is a safe and effective method of exfoliation for the face, neck and body.

The Microdermabrasion process uses a gentle stream of fine micro-crystals which are sprayed at high velocity across the skin's surface. The dead cells together with the skin's impurities are whisked away to a collecting container through a hygienic closed-loop system for disposal. The exfoliation achieved with this system leaves the skin feeling and looking smooth, soft, and refreshed.

Fine lines, wrinkles, sun damage, dry skin conditions, hyperpigmentation, acne, chicken pox scars, and other skin abnormalities are less noticeable, and the skin has a younger appearance.

Microdermabrasion is safe for all types of skin. From teenage to mature skin, it improves the texture of the skin.

A series of Microdermabrasion treatments are recommended to help remove the Stratum Corneum, the outer layer of dead and dry skin cells, thereby "opening the door" to increased cell renewal and resurfacing.
